**DIVIDES THE SPACES**

## **Hubbles: make room for your tomorrow**

Our company offers a modern and functional collection of strong and well-equipped dividing partitions, which can easily be incorporated with floors, floating floors, ceilings, countertops, walls.

The dividing partition Hubbles is a clear example of our long-lasting experience in the industry of organizational space, guaranteeing maximum reliability and competence in the planning, production, installation and post-sales assistance sections.

## Inspiration beyond limits

Think, build and share a workplace, experience it by making it unique and easy to use, design it to make sure that information flows, transparencies and volumes become containers of ideas in synergy, and create a microcosm where space and time unfold in a new dimension, a higher state of consciousness that returns to put man at the centre of everything. A sophisticated, elegant, prestigious office? Yes, but only with the magic of glass. Indeed, with the magic of the monolithic Hubbles partition walls. The glass partition walls make it possible to reorganize the distribution of spaces effectively

## Harmony and structural quality

Harmonic and essential lines draw space. Shininess, permeability and lightness are the characteristics of the monolithic wall system. Taking advantage of the glass capacity and the modularity of the system, the monolithic wall system allows large and continuous glazed surfaces with modules one after the other, without intermediate uprights.

It is the ideal solution when the architectural project requires visual lightness, little space and easy assembly.

The single glass wall can be easily integrated with the other dividing systems to create bright, elegant but also functional spaces.

**The rationality around the corner.**

Knots and angles. The glass and wooden elements adhere to each other thanks to the system of transparent polycarbonate joints. Linear or angular elements are designed to have a perfect coplanarity and stability of the plates and the infill panels. The Hubbles wall also includes a technical module, which is connected to the upright to house the wiring and allows the installation of sockets, push-button panels and signalling screens.

## Light design

The monolithic HUBBLES wall, is a system for the division of interior spaces with a lower and upper profile of 40 mm in width and 25 mm in height, made of primary alloy aluminium, designed to accommodate modules in laminated glass or melamine panels.

The profiles are in silver oxidised aluminium finish, can be painted in the RAL range or offered in other finishes such as the polished or brushed ones. The monolithic HUBBLES wall provides the possibility of being mounted separately or aggregated to other distribution systems.

The glass can be supplied, as well as in the standard types, with screen printing, in drawing and coloured, in order to satisfy all design request

## ACUSTIC COMFORT

The combination of different finishes and materials make it possible to rationalize the rooms, divide the space and create functional offices.

It allows you to work in a confidential manner within an office, allowing you to glimpse at the same time what is happening around, thus ensuring greater ease of communication. Hubbles walls are high performance in terms of acoustics and reaction to fire, their use is recommended in all modern offices where acoustic comfort and safety are essential;

With sound-absorbing walls, on the other hand, the acoustics of the spaces are improved, noise pollution is reduced and more privacy is created, which is essential in order to work well and productively
